Q3.

Hillclimbing:我鄰居的定義是任意一個棋子在直行中移動,因此原圖與鄰居只會相差一顆棋子,然後將原圖更新為最好的鄰居,直到沒有鄰居比原圖更好為止

GA:我這次是用 interger 的 array,而且 array 中沒有 element 是重複的,我每個 step 從 100 個親代中找最好的產生兩個子代,並將產生的子代與親代比較,刪除 attacks 數最多的兩個,我的 crossover 是用 cycle crossover,而 mutation 是用 random 產生兩個數字,再將兩個數字 mod size,如果 mod 後的數字一樣就不會產生 mutation,如果不一樣則兩者互換。不過由上面城市的截圖可以發現我這個 GA 的方式不夠好,在大資料中甚至比 HC 的 performance 還要差,我覺得造成這樣的問題的可能有兩個,一個是我一個 step 產生的子代不夠多,我應該在一個 generation 產生多一點的子代,第二點就是可能不需要限定 array 中的每個數字不一樣,雖然要 success 每個 array 中的數字一定要不一樣,但說不定因為沒有限制不一樣,壤子代產生的可能性和變化性也會增加,也更容易找到最佳解。
